TITLE OF THE INVENTION

OXO-ANALOGS OF MEVINOLIN-LIKE ANTIHYPER-CHOLESTEROLEMIC AGENTS

5 SUMMARY OF THE INVENTION

This invention is concerned with novel compounds of structural formula I:

I

10

wherein Z is a variety of mono- and bi-carbocyclic moieties with various substituents well known to those skilled in the art of 3-hydroxy-3-methyl-glutaryl Coenzyme A (HMG-CoA) reductase inhibitors useful in the treatment of familial hyper-cholesterolemia, hyperlipemia and atherosclerosis.

The invention is also concerned with novel processes for the preparation of the novel compounds; pharmaceutical formulations comprising a novel compound as active ingredient; and a method of treating familial hypercholesterolemia, hyperlipemia, and atherosclerosis.

BACKGROUND OF THE INVENTION

5

10

15

20

Over the past several years a number of structurally related antihypercholesterolemic agents acting by inhibition of HMG-CoA reductase have been reported in the patent literature and elsewhere. The compounds have varied from the natural fermentation products, compactin and mevinolin,

Compactin $(R^2=H)$ Mevinolin $(R^2=CH_3)$

25 to di- and tetrahydro derivatives thereof; to analogs with different esters in the 8-position of the polyhydronaphthalene moiety, to totally synthetic analogs, wherein the polyhydronaphthalene moiety is replaced by substituted mono- and bicyclic aromatics, and biphenyls. But in all instances the active compound included a 4-hydroxytetrahydropyran-2-one ring or the corresponding 3,5-dihydroxy acid, or derivatives thereof, formed by opening the pyranone ring such as:

15

20

25

30

4-hydroxytetrahydropyran-2-one 3,5-dihydroxy-acid

In all of these compounds the 3,5-dihydroxy acid or corresponding lactone moiety is present and the particular stereochemistry depicted is essential for manifestation of the optimum enzyme inhibitory activity.

Now with the present invention there are provided compounds structurally related to those lactones and dihydroxy acids that do not have the 5-hydroxy functionality, do not form a lactone ring, and are incapable of stereochemical variation at the 5-position of the acid because the 5-carbon is not asymmetric. On the contrary, the 5-carbon carries an oxo function which greatly facilitates the total synthesis of active compounds in that by eliminating one asymmetric center it is unnecessary to separate diastereoisomers or to conduct a stereoselective synthesis to obtain optimum enzyme inhibitory activity. It is believed that structures I are reduced in situ to generate the "active" inhibitors of structure II or IIa.

The active compounds of this invention are useful in either the racemic form or as the 3(R)-isomer. Those compounds produced by total synthesis are obtained initially as racemates, but

may be resolved by standard methods into 3(R) - and 3(S) - isomers. Compounds of Structure I which are synthesized starting from natural fermentation products such as mevinolin and its analogs are obtained as the optically pure 3(R) - isomers.

One novel process for preparing the novel compounds of this invention is particularly useful 30 when starting with compounds with a pre-formed 4-hydroxytetrahydropyran-2-one moiety or the corresponding 3,5-dihydroxy acid and is illustrated as follows:

$$+ \sin \frac{1}{2} \cos \frac{1}{2} \cos$$

5

30

wherein R¹⁶ is C₁₋₄alkyl, especially methyl.

After protecting the 4-hydroxyl of the lactone with a dimethyl-tert-butylsilyl group and preparing an alkyl ester by known procedures, the resulting 5-hydroxy of the open-chain acid is oxidized to the ketone.

Suitable oxiding agents include: pyridinium chlorochromate in a chlorinated alkane such as methylene chloride or chloroform at about 0° to about 25°C for about 1 to 4 hour; oxalyl chloride in dimethylsulfoxide at about -70° to about -40°C for about 0.25 to 0.5 hours; trifluoroacetic anhydride in dimethylsulfoxide at about -70° to -40°C for about 0.25 to 0.5 hour; and pyridinium dichromate in dimethyl formamide at 0° to 25°C for 1 to 8 hours.

The silyl ether group is then hydrolyzed by treatment with acetic acid and tetrabutylammonium fluoride in tetrahydrofuran.

A related procedure is available for preparing compounds of this invention wherein E represents -CH₂-CH₂-. It obviates the need for protection of the 3-hydroxy group before oxidizing the 5-hydroxy and is represented as follows:

In the first step the dihydroxy compound is treated with activated manganese dioxide in a chlorinated hydrocarbon such as chloroform, methylene chloride, 1,2-dichloroethane or the like at about 0°C to 40°C preferably at ambient temperature for about 15 to 30 hours. The 5-oxo compound produced is then treated with tri-n-butyltin hydride and tetrakis(triphenyl-phosphine)palladium(0) in an ethereal solvent such as ether, THF, 1,2-dimethoxyethane or the like, at about ambient temperature for about 15 to 30 hours.

Alternatively, if the 3-hydroxy-5-oxo-carboxylic acid moiety is being synthesized, the 5-oxo group is realized directly by a process which is another embodiment of this invention and which is exemplified as follows:

30
$$C_{2}^{NO_{2}}$$
 $C_{6}^{H_{5}NCO}$ $C_{2}^{C_{6}H_{5}NCO}$ $C_{2}^{C_{6}H_{5}NCO}$ $C_{2}^{C_{6}H_{5}NCO}$ $C_{2}^{C_{6}H_{5}NCO}$

The nitro compound is treated with a C_{1-4} alkyl 3-butenoate, preferably methyl 3-butenoate, and an aromatic isocyanate such as p-toluoyl isocyanate, p-chlorophenyl isocyanate, phenyl isocyanate or the like, preferably the latter, and a bit of triethylamine as a catalyst in an inert organic solvent such as toluene, benzene, xylene, or the like at about 15 to 30°C, preferably about room temperature for about 5 to about 24 hours.

5

20

25

The resulting isoxazoline is reduced catalytically with palladium on carbon, platinum oxide or the like in an inert organic solvent such as a C₁₋₃alkanol, acetic acid or the like containing a little water in the presence of boric acid at about 15 to 30°C and about 1-2 atmospheres of hydrogen pressure for about 1 to 6 hours.

The ester resulting from either of the foregoing synthetic schemes is readily saponified to the corresponding carboxylic acid salt by treatment with aqueous alkali such as potassium, or sodium hydroxide to form the potassium or sodium salt respectively or with a quaternary ammonium hydroxide of formula ${\rm HONR}^3{\rm R}^4{\rm R}^5{\rm R}^6$ wherein none of the R groups is hydrogen to form the quaternary ammonium salt.

Acidifying any of these salts with a mineral acid results in the formation of the free carboxylic acid.

The acids are readily converted back to 30 salts by treatment with the appropriate base or to esters by treatment with a C₁₋₄alkanol in the presence of a catalytic amount of an acid such as hydrogen chloride at about 50 to 100°C for about 3 to 6 hours.

The previously described salts are converted back to esters by treatment with an alkyl halide such as 2,3-dihydroxypropyl iodide in an aprotic solvent such as N,N-dimethylformamide, N-methylpyrrolidone or hexamethylphosphoramide at about 25 to 100°C for about 18 to 36 hours.

Those compounds, wherein Z is of the subtype (4), i.e., in which the polyhydronaphthalene moiety is substituted with hydroxy or oxo, halo or alkoxy are prepared from the corresponding substrate in which the 5-oxo group of the heptenoic acid is already in place. The processes, as applied to the 5-hydroxy analogs or the corresponding lactones, are disclosed in EP application 76601, British patents 2,111,052 and 2,075,013, EP application 74222, and Japanese published applications J58010572 and J57155995. Using those processes there are produced the following compounds: HO

The novel pharmaceutical composition of this
invention comprises at least one of the compounds of
formula I in association with a pharmaceutical
vehicle or diluent. The pharmaceutical composition
can be formulated in a classical manner utilizing

solid or liquid vehicles or diluents and pharmaceutical additives of a type appropriate to the mode of desired administration. The compounds can be administered by an oral route, for example, in the form of tablets, capsules, granules or powders, or they can be administered by a parenteral route in the form of injectable preparations.

5

10

A typical capsule for oral administration contains active ingredient (25 mg), lactose (75 mg) and magnesium stearate (15 mg). The mixture is passed through a 60 mesh sieve and packed into a No. 1 gelatin capsule.

A typical injectable preparation is produced by asceptically placing 25 mg of a water soluble salt of sterile active ingredient into a vial, asceptically freeze-drying and sealing. For use, the contents of the vial are mixed with 2 ml of physiological saline, to produce an injectable preparation.

The novel method of treating

atherosclerosis, familial hypercholesterolemia, or hyperlipemia of this invention comprises administration of an effective antihypercholesterolemic amount of a compound of Formula I to a patient in need of such treatment.

The dose to be administered depends on the unitary dose, the symptoms, and the age and the body weight of the patient. A dose for adults is preferably between 20 and 2,000 mg per day, which can be administered in a single dose or in the form of individual doses from 1-4 times per day.

The compounds of this invention also have useful antifungal activities. For example, they may be used to control strains of <u>Penicillium</u> sp.,

Aspergillus niger, Cladosporium sp., Cochliobolus miyabeorus and Helminthosporium cynodnotis. For those utilities they are admixed with suitable formulating agents, powders, emulsifying agents or solvents such as aqueous ethanol and sprayed or dusted on the plants to be protected.

This invention can be illustrated by the following examples.

Step A: Preparation of Methyl 3-(4'-Fluoro-3,3',5trimethyl-[1,1'biphenyl]-2-yl)propionate

A solution of 1.716 g (13 mmol) of dimethyl malonate in 5 ml of DMF was added dropwise to a stirred suspension of sodium hydride (50% oil dispersion, 0.624 g, 13 mmol) in 15 ml of DMF and stirring was continued under nitrogen for 0.5 hour. A solution of 3.42 g (11.4 mmol) of the ester from Step A in 25 ml of ether was added

dropwise to a stirred suspension of 0.38 g (10 mmol) of lithium aluminum hydride in 75 ml of ether at 0°C under nitrogen. After completion of the addition, the mixture was stirred at room temperature for 15 minutes, refluxed for 1 hour, cooled in ice and treated with successive additions of 0.4 ml of water, 0.35 ml of 20% (w/v) aqueous sodium hydroxide and 1.1 ml of water. Step C: Preparation of 2-(3-Bromopropyl)-4'-fluoro-3,3',5-trimethyl-1,1'-biphenyl

20 A solution of 1.08 g (4 mmol) of PBr, in 10 ml of ether was added dropwise to a stirred solution of 3.08 g (11.3 mmol) of the alcohol from Step B in 40 ml of ether at 0°C. The mixture was stirred at room temperature for 1 hour, refluxed for 25 0.5 hour, cooled to room temperature, poured into ice water and extracted with ether. The extract was washed with water and saturated aqueous sodium bicarbonate, dried over MgSO, filtered and evaporated to dryness in vacuo. The residue was 30 purified by flash chromatography on silica gel (230-400 mesh) by elution with methylene chloride/hexane (1:3, v/v). Combination and evaporation of the appropriate fractions gave the

desired bromide as a pale yellow oil, (1.9 g, 5.67
